CHARACTERISTIC 8

Characteristic 8: A difference in a syntactically adequate word order has to be considered as a genealogical variation, as long as the difference in word order does not merely concern a different placement of an adverb in a verse or sentence.

8.1 POSSIBLY ACCEPTABLE (TYPE-2) VARIATIONS IN WORD ORDER

CHARACTERISTIC 9

Characteristic 9a: When text-genealogical variants are part of rhyming texts and they stand in a rhyming position, they have to obey (at least assonantic) rhyming conventions.
Characteristic 9b, a special case of the violation of rhyming conventions, concerns duplicate rhyming words. This characteristic occurs when one verse ends with a certain rhyming word and the immediately following verse ends with the same word. The philologist must study these verses closely, because it is very likely that in these verses or their environment an error in the transmission process occurred.

9.1 CHARACTERISTIC 9A: VIOLATIONS OF RHYMING CONVENTIONS

9.1.1 VIOLATIONS OF RHYMING CONVENTIONS IN TYPE-1 ENVIRONMENT

9.1.1.1 Violations of Rhyming Conventions in Type-1 Environment, Concerning Vowels, Easy to be Repaired

9.1.3 OTHER OCCURRENCES OF CHARACTERISTIC 9A

In the following paragraphs characteristic 9a has been discussed as well:
5.2.1.2 (= §7.1.1.4) Combinations of Characteristics 5, 7a and 9
5.2.2.2 (= §7.2.4.1) Combinations of Characteristics 5, 7b and 9
5.3.2 Characteristic 5 and Non-Informative Characteristic 6a(/7a) (Possibly in Combination with Characteristic 7d or 9)
5.3.3 Characteristic 5 and Non-Informative Characteristic 7a (Possibly in Combination with Characteristic 7d or 9)
5.3.4 Characteristic 5 and Non-Informative Characteristic 7B (Possibly in Combination with Characteristic 9)
5.3.5 Characteristic 5 and Non-Informative Characteristic 7C (Possibly in Combination with Characteristic 9)
5.3.6 Characteristic 5 and Non-Informative Characteristic 7D (Possibly in Combination with Characteristic 9) (see also §5.3.2 and §5.3.3)
5.3.7 Characteristic 5 and Characteristic 9
7.1.1.6 Potential Affix Cases in Combination with Characteristic 9
7.2.1.5 Different Vowels in Combination with Characteristics 9

Characteristic 9a is mentioned in some other paragraphs as well. The paragraphs are mentioned at the end of the formula between brackets, after my intials BS and 'Source ='. It will be clear that these remarks '(BS ...)' have been added by me especially in this paragraph.

```

9.2 CHARACTERISTIC 9B: DUPLICATE RHYMING WORDS

9.2.1 DUPLICATE RHYMING WORDS IN TYPE-1 ENVIRONMENT

02.0077 ?obs01: the pair (~here - ~here) of text 14- near 02.77 consists of duplicate words;T1?;9b
02.0078 ?obs01: the pair (~here - ~here) of text 14- near 02.77 consists of duplicate words;T1?;9b
02.0594 ?obs01: the pair (~sin - ~sin) of text 08- near 02.594 consists of duplicate words;T1?;9b
02.0595 ?obs01: the pair (~sin - ~sin) of text 08- near 02.594 consists of duplicate words;T1?;9b
02.0827 ?obs01: the pair (~mode | ~mode) of text 02- near 02.827 consists of duplicate words;T1?;9b
02.0828 ?obs01: the pair (~mode | ~mode) of text 02- near 02.827 consists of duplicate words;T1?;9b

9.2.2 DUPLICATE RHYMING WORDS IN TYPE-2 ENVIRONMENT

02.0212 ?obs01: the pair (~gesgin - ~gesgin) of texts 07-08- near 02.212 consists of duplicate words;T2?;9b
02.0213 ?obs02: the pair (~gesgin - ~gesgin) of texts 07-08- near 02.212 consists of duplicate words;T2?;9b
Comment: One would have expected ‘ghesien’ (in shorthand: ‘gesin’) in the verses of texts 07 and 08, like text 06 has near verse 02.0212. In fact, both observations, of 02.0212 and 02.0213 are the same. We could rewrite the second formula into a plain T2 formula, taking into account that texts 03 and 14 are not delivered:
02.0212 12 obs01: 07-08-|01-02-04-05-06-09-10-11-12-13-: two duplicate (= 1 incorrect) rhyming words;T2;9b
Almost all the texts 01-02-04-05-06-09-10-11-12-13- have the shorthand word ‘gesin’ as a rhyming word. Text 01, however, has another rhyming word: ‘sandrin’. To be on the save site, we scratch text 01 out of the proposed formula:
02.0212 11 obs01: 07-08-|02-04-05-06-09-10-11-12-13-: 2 duplicate (= 1 incorrect) rhyming words;T2;9b
Notice, furthermore, that this formula contains ‘directional’ information: the incorrect rhyming scheme in text 07 and 08 will not have been the original rhyming scheme.
02.0232 ?obs02: the pair (~genog - ~genog) of texts 07-09-11-12-13- near 02.232 consists of duplicate words;T2?;9b
02.0233 ?obs02: the pair (~genog - ~genog) of texts 07-09-11-12-13- near 02.232 consists of duplicate words;T2?;9b
Comment: This variation concerning the verses near 02.232 is caused by the fact that the printing character ‘u’ has turned 180 degrees, by which it became an ‘n’ on paper. This error occurs frequently in the printed *Lanseloet van Denemerken* text versions, by which it becomes possible that it pops up in different, not related text versions. In other words, when variants are caused by a turned ‘u’ or ‘n’, the danger of parallelism is present. Furthermore, copyists or printers can rather easily emend such an erronous ‘u’ or ‘n’, which points again at the danger of parallelism. Therefore we will not use this variation formula. (Comment put in after the tree of the *Lanseloet van Denemerken* text versions had been developed: the turning of the ‘u’ into an ‘n’ occurred twice, independently from each other; once in the area of the family or forefather of texts 07 and 08, and once in the area of texts 11, 12, 13 (and 14). Therefore, this is a good example of actually existing parallelism.)
02.0679 ?obs01: the pair (~stont - ~stont) of texts 02-04-06-07-08- near 02.679 consists of duplicate words;T2?;9b
02.0680 ?obs01: the pair (~stont - ~stont) of texts 02-04-06-07-08- near 02.679 consists of duplicate words;T2?;9b
Comment: This variation cannot easily be repaired by copyists or printers; therefore, it may serve for text-genealogical purposes. We rewrite the second variation formula into:
02.0680 12 obs01: 02-04-06-07-08-|01-05-09-10-11-12-13-: 2 duplicate (= 1 incorrect) rhyming words;T2;9b
However, not the complete group 01-05-09-10-11-12-13- have the variant ‘vont’: text 01 has ‘gesont’ and text 05 has ‘kont’. Therefore, we rewrite the variation formula into:
02.0680 10 obs01: 02-04-06-07-08-|09-10-11-12-13-: 2 duplicate (= 1 incorrect) rhyming words;T2;9b
02.0739 ?obs05: the pair (~hant | ~hant) of texts 04-05- near 02.739 consists of duplicate words;T2?;9b
02.0740 ?obs03: the pair (~hant | ~hant) of texts 04-05- near 02.739 consists of duplicate words;T2?;9b
Comment: Assuming that the variants ‘lang’ (in texts 12 and 13) and ‘lank’ (in texts 02, 06, 07, 08, 09, 10 and 11) are the same, and taking into consideration that text 01 has a different rhyming word ‘wigant’) we rewrite the second formula into:
02.0740 11 obs03: 04-05-|02-06-07-08-09-10-11-12-13-: 2 duplicate (= 1 incorrect) rhyming words;T2;9b

Summary of §9.2.2, including the judgement of the philologist

02.0212 11 obs01: 07-08-|02-04-05-06-09-10-11-12-13-: 2 duplicate (= 1 incorrect) rhyming words;T2;9b
02.0680 10 obs01: 02-04-06-07-08-|09-10-11-12-13-: 2 duplicate (= 1 incorrect) rhyming words;T2;9b
02.0740 11 obs03: 04-05-|02-06-07-08-09-10-11-12-13-: 2 duplicate (= 1 incorrect) rhyming words;T2;9b

9.2.3 OTHER OCCURRENCES OF CHARACTERISTIC 9B

The following variation formulas have been discussed already in the previous paragraph. The difference is that we deal here with true formulas, while in the previous paragraph only observations have been mentioned.

02.0212 11 ^comb.: 07-08-|02-04-05-06-09-10-11-12-13-="~gesgin"|"~gesin" (wds r.p;5) (conventions pure rhyme violated;9b)
02.0232 11 ^comb.: 07-09-11-12-13-|01-02-04-05-06-10-="~genog"|"~gevog" (wds r.p;5) (conventions pure rhyme violated;9b)
02.0680 10 ^comb.: 02-04-06-07-08-|09-10-11-12-13-="~stont"|"~vont" (wds r.p;5) (conventions pure rhyme violated;9b)
02.0740 09 ^comb.: 04-05-|02-06-07-08-09-10-11-="~hant"|"~lank" (wds r.p;5) (conventions pure rhyme violated;9a;9b)
02.0740 04 ^comb.: 04-05-|12-13-="~hant"|"~lang" (wds r.p;5) (conventions pure rhyme violated;9a;9b)

CHARACTERISTIC 10

Characteristic 10: The inversion of (rhyming words of) verses is genealogical informative when these verses fit well in the text.

10.1 INVERSION OF VERSES: TYPE-2 VARIATION FORMULAS

```
   02.0746 11  obs01: 09-10-11-12-13-|02-04-05-06-07-08-: rhyming pair (~sandrin - ~guldin) of text 02
                      (near 02.746) is inverted in texts 09-10-12-12-13- (T2);10
               Comment: We must integrate in this formula the fact that text 01 has "sanderin", which
                      results into the new formula:
02.0746 12  obs01: 09-10-11-12-13-|01-02-04-05-06-07-08-: rhyming pair (~sandrin - ~guldin) of text 02
                      (near 02.746) is inverted in texts 09-10-12-12-13- (T2);10
   02.0747 11 ^obs01: 09-10-11-12-13-|02-04-05-06-07-08-: rhyming pair (~sandrin - ~guldin) of text 02
                      (near 02.746) is inverted in texts 09-10-12-12-13- (T2);10
               Comment: We will not use this formula, since it is more or less equal to the previous formula.
```

10.2 INVERSION OF VERSES: TYPE-1 VARIATION FORMULAS

```
02.0020 13 ^obs01: 01-|02-04-05-06-07-08-09-10-11-12-13-14-: rhyming pair (~min - ~sin) of text 02 (near 02.20)
                   is inverted in text 01 (T1);10
02.0021 13 ^obs01: 01-|02-04-05-06-07-08-09-10-11-12-13-14-: rhyming pair (~min - ~sin) of text 02 (near 02.20)
                   is inverted in text 01 (T1);10
02.0034 12 ^obs01: 01-|02-04-05-07-08-09-10-11-12-13-14-: rhyming pair (~bewaren - ~sparen) of text 02 (near
                   02.34) is inverted in text 01 (T1);10
02.0035 12 ^obs01: 01-|02-04-05-07-08-09-10-11-12-13-14-: rhyming pair (~bewaren - ~sparen) of text 02 (near
                   02.34) is inverted in text 01 (T1);10
02.0055 12 ^obs01: 01-|02-04-05-06-07-09-10-11-12-13-14-: rhyming pair (~vrindinne - ~minne) of text 02 (near
                   02.55) is inverted in text 01 (T1);10
02.0056 12 ^obs01: 01-|02-04-05-06-07-09-10-11-12-13-14-: rhyming pair (~vrindinne - ~minne) of text 02 (near
                   02.55) is inverted in text 01 (T1);10
02.0522 09 ^obs01: 09-|01-02-05-10-11-12-13-14-: rhyming pair (~haten - ~laten) of text 02 (near 02.522) is
                   inverted in text 09 (T1);10
02.0523 09 ^obs03: 09-|01-02-05-10-11-12-13-14-: rhyming pair (~haten - ~laten) of text 02 (near 02.522) is
                   inverted in text 09 (T1);10
02.0777 13 ^obs01: 14-|01-02-04-05-06-07-08-09-10-11-12-13-: rhyming pair (~beginne - ~minne) of text 02 (near
                   02.777) is inverted in text 14- (T1);10
02.0778 13 ^obs01: 14-|01-02-04-05-06-07-08-09-10-11-12-13-: rhyming pair (~beginne - ~minne) of text 02 (near
                   02.777) is inverted in text 14- (T1);10
```

CHARACTERISTIC 11

Characteristic 11a: The addition (or 'interpolation') and omission of words is genealogically informative when these words fit well or offer no crucial information.
Characteristic 11b: The addition and omission of complete verses is genealogically informative when these verses fit well or offer no crucial information.

11.1 CHARACTERISTIC 11A, CONCERNING MISSING/ADDED WORDS

11.1.1 MISSING/ADDED WORDS: PRESENTATION ACCORDING TO OCCURRENCE IN VERSES

```

11.2 CHARACTERISTIC 11B, CONCERNING MISSING/ADDED VERSES

11.2.1 SOME TEXTS HAVE ‘EMPTY’ VERSES

11.2.1.1 ‘Empty’ Verses in Type-2 Environment: Judgement Philologist Needed

In this paragraph the ‘holes’ or empty verses (from the perspective of the base text 02) are presented. Characteristic 11b tells us that only absent verses that fit well in the text are text-genealogically informative. ‘Fit well’ seems to imply a subjective judgement of the

philologist. However, my judgements, offered below, can be automated in the future as well. I judged the empty verses in two steps. First, I checked the purity of the computer observation: it is for instance possible, that in some texts only one verse is missing, while the hole in other texts is much bigger, consisting, for instance, of eight missing verses; therefore, both holes are different holes with a different size; these holes must be treated as as two (or even more) different observations. Second, I looked word by word at the contents of the present verses. When one or more verses clearly differs from the other competitive verses, it is likely that the absence of a verse led to the raise of a new verse, present in one or more text versions. When, on the other hand, all present verses are very much alike, it is likely that no copyist tried to fill the hole of the empty verse. Then the text versions tell us themselves that an

```

11.2.2 SOME TEXTS HAVE ‘EXTRA’ VERSES

11.2.2.1 ‘Extra’ Verses in T2 Environment: Judgement Philologist Needed

```
02.0082 12 ?obs01: 11-12-13-14-|01-02-05-06-07-08-09-10-: TWO or more rules (T2);11b; philologist...
          Comment: This is a text-genealogically informative addition or interpolation of the verse "Of dat ick
                   niet hoef te klagen" in the four texts 11-12-13-14. This interpolation leads to a ‘harmless’
                   break in rhyming scheme of these four texts. Harmless, because the interpolation does not lead
                   to a change in the accompanying verses in any text.
02.0377 12 ?obs01: 02-05-06-07-08-09-10-11-12-13-|01-14-: TWO or more rules (T2);11b; philologist...
          Comment: This formula expresses that texts 02, 05 etc. have two or more verses, while texts 01 and 14
                   have a single verse. The fact that texts 01 and 14 do not show extra verses is probably
                   parallelistic, caused by the fact that both texts were pure drama texts, while the other
                   twelve Lanseloet van Denemerken text versions were reading texts. Therefore, we will not use
                   it as a text-genealogically informative observation.
                   The added verses, at the end of a Sandrijn clause, concern ‘commentary’ verses. In general,
                   text 01 does not have such commentary verses. As far as I can see, the only commentary-like
                   verses in text 01 are the final verses: the ‘Conclusie’ (near verse 02.989 and further), which
                   is spoken in text 01 by Reinout, as pointed out by the clause header ‘@ Reinout’ (see verse
                   01.1018). Of course the final clause header ‘Conclusie’ does not refer to a person in the
                   drama. It is addressed to a reading audience. Text 14 only has the role texts of Lanseloet and
                   of Sandrijn. Probably the added commentary verses, not strictly belonging to one acting person
                   in the play, have been spoken out by another person in text 14, of whom we do not have the
                   role text. Possibly, like in text 01, the commentary verses were spoken by Reinout. Notice
                   that text 14 also lacks the commentary verses at the end of a Lanselot clause near verse
                   02.277.
02.0523 11 ?obs01: 12-13-14-|01-02-05-06-07-08-09-11-: TWO or more rules (T2);11b; philologist...
          Comment: This is a text-genealogically informative interpolation of two well-fitting rhyming verses
                   "Ick meyne dat ’et schoonste is van love/" and "Dat ’er leyt in desen Hove".
02.0692 12 ?obs01: 04-05-06-07-08-09-10-11-12-13-|01-02-: TWO or more rules (T2);11b; philologist...
          Comment: This observation cannot be used easily, because the verses of text 01 are quite different from
                   the verses in the other texts. Furthermore, the interpolation of the verses is difficult to
                   judge:
                   - Rhyming scheme of text 01: {711-ghedaen (712-clause header) 713-
                       verstaen}, {714-dach 715-sach}, {716-waer 717-jaer}; a sound rhyming
                       scheme.
                   - Rhyming scheme of text 02: {689-mach (690: clause header) 691-dach},
                       {692-sach} {693-waer 694-iaer}; inadequate rhyming scheme, because
                       verse 692 stands alone.
                   - Rhyming scheme of text 04 (and 06 to 13): {213-mach (214: clause header)
                       215-dac(h)}, {216-sach lijden 217-rijden} {218-waer 219-iaer}.
                   - Rhyming scheme of texts 05: {698-mach (699: clause header) 700-dach},
                       {701-sach 702-riden} {703-waer 704-iaer}.
                   It is, however, clear that texts 04 to 13 share the extra verse ending with ’rijden’/’riden’;
                   such an extra verse does not occur in text 01, nor in text 02. On the other hand texts 01 and
                   02 differ too much to say that there is a group 01-02- with other contents than the group 04-
```

```
                  05-06-07-08-09-10-11-12-13-. It is more safe to change the observation into:
   02.0692 11  obs01: 04-05-06-07-08-09-10-11-12-13-|02-: TWO or more rules (T1);11b;
                       ( Maybe the following has happened; a copyist had (a copy of) text 02 as his layer text;
                       he noticed the imperfect (and therefore unoriginal) rhyming scheme and added the word
                       'lijden' and the extra verse ending with 'rijden' in his new copy. This new copy was the
                       forefather of text group 04-(05-)06-07-08-09-10-11-12-13-. )
02.0999 11 ?obs01: 11-12-13-|02-04-05-06-07-08-09-10-: TWO or more rules (T2);11b; philologist...
          Comment: This is a text-genealogically informative interpolation of the comment-like rule "Exempel." in
                   the three texts mentioned.
```

Summary of §11.2.2.1, including the judgement of the philologist:

02.0082 12 obs01: 11-12-13-14-|01-02-05-06-07-08-09-10-: TWO or more rules (T2);11b;
02.0523 11 obs01: 12-13-14-|01-02-05-06-07-08-09-11-: TWO or more rules (T2);11b;
02.0692 11 obs01: 04-05-06-07-08-09-10-11-12-13-|02-: TWO or more rules (T1);11b;
02.0999 11 obs01: 11-12-13-|02-04-05-06-07-08-09-10-: TWO or more rules (T2);11b;

11.2.2.2 'Extra' Verses in T1 Environment

11.2.2.2.1 'Extra' Verses in T1 Environment: Judgement Philologist Needed

```
02.0159 11 ?obs01: 01-05-06-07-08-09-10-11-12-13-|02-: TWO or more rules (type-1; interesting);11b;
                   philologist...
          Comment: Text 02 shows a break in the rhyming scheme: it lacks a verse that rhymes with the following
                   verse ending with 'marien'; logically, text 02 cannot be the original text.
02.0277 12 ?obs01: 04-05-06-07-08-09-10-11-12-13-14-|02-: TWO or more rules (type-1; interesting);11b;
                   philologist...
          Comment: (See also the end of the comment near verse 02.0377 in the previous paragraph 11.2.2.1.) A
                   close study of the extra verses shows that text 08 has an extra verse 08.279 'Dat niemant sal
                   gayn dair jn', which is not present in any other text; therefore, we build an extra handmade
                   formula:
02.0462 11 ?obs01: 01-05-06-07-08-09-10-11-12-13-|02-: TWO or more rules (type-1; interesting);11b;
                   philologist...
           Comment: Text 02 shows a break in the rhyming scheme: it lacks a verse that rhymes with the verse
                   ending with 'juweel' or 'casteel'; logically, text 02 cannot be the original text.
02.0600 12 ?obs01: 01-05-06-07-08-09-10-11-12-13-14-|02-: TWO or more rules (type-1; interesting);11b;
                   philologist...
          Comment: Text 02 shows a break in the rhyming scheme: it lacks a verse that rhymes with the verse
                   ending with 'brut' or 'bruyt'; logically, text 02 cannot be the original text.
02.0951 13 ^obs01: 08-|01-02-04-05-06-07-09-10-11-12-13-14-: TWO or more rules (type-1; interesting);11b;
                   philologist...
          Comment: The second verse clearly belongs to the next clause.
02.1012 11 ?obs01: 02-04-05-06-07-08-10-11-12-13-|09-: TWO or more rules (type-1; interesting);11b;
                   philologist...
          Comment: Several observations are possible concerning the final verses of the texts mentioned: 04-05
                   end with a colophon ("Gheprent Tantwerpen"), 06-07-08- have more or less the same final verses
                   ("Hier eyndet"); 09 and 10 end with a simple "FINIS", while texts 11-12-13- have an extra
                   "testament" of about 25 verses.
```

11.2.2.2.2 Other 'Extra' Verses in T1 Environment

```
02.0072 12 ^obs01: 01-|02-05-06-07-08-09-10-11-12-13-14-: TWO or more rules (T1);11b
02.0124 12 ^obs01: 01-|02-05-06-07-08-09-10-11-12-13-14-: TWO or more rules (T1);11b
02.0163 11 ^obs01: 01-|02-05-06-07-08-09-10-11-12-13-: TWO or more rules (T1);11b
02.0259 12 ^obs01: 01-|02-04-05-06-07-08-09-10-11-12-13-: TWO or more rules (T1);11b
02.0280 12 ^obs01: 01-|02-04-05-06-07-08-09-10-11-12-13-: TWO or more rules (T1);11b
02.0295 12 ^obs01: 01-|02-04-05-06-07-08-09-10-11-12-13-: TWO or more rules (T1);11b
02.0308 12 ^obs01: 01-|02-04-05-06-07-08-09-10-11-12-13-: TWO or more rules (T1);11b
02.0394 12 ^obs01: 01-|02-03-05-06-07-08-09-10-11-12-13-: TWO or more rules (T1);11b
02.0406 12 ^obs01: 01-|02-03-05-06-07-08-09-10-11-12-13-: TWO or more rules (T1);11b
02.0497 12 ^obs01: 01-|02-05-06-07-08-09-10-11-12-13-14-: TWO or more rules (T1);11b
02.0547 10 ^obs01: 10-|02-05-06-07-08-09-11-12-13-: TWO or more rules (T1);11b
          Comment: The extra verse contains an incorrect (extra) clause header of Sandrijn.
02.0608 12 ^obs01: 01-|02-05-06-07-08-09-10-11-12-13-14-: TWO or more rules (T1);11b
02.0690 12 ^obs01: 01-|02-04-05-06-07-08-09-10-11-12-13-: TWO or more rules (T1);11b
02.0873 12 ^obs01: 14-|01-02-05-06-07-08-09-10-11-12-13-: TWO or more rules (T1);11b
          Comment: The extra verse contains the information that the role was played in the year 1720. It is not
                   very likely that a copyist having text 14 as his layer text (= text to be copied) would copy
                   this obviously extra information into his text.
02.0911 11 ^obs01: 01-|02-05-06-07-08-09-10-11-12-13-: TWO or more rules (T1);11b
02.0951 13 ^obs01: 08-|01-02-04-05-06-07-09-10-11-12-13-14-: TWO or more rules (T1);11b
          Comment: The extra verse has not been placed well by the copyist of text 08: it clearly is a verse that
                   should belong to the next clause. A new copyist having text 08 as his layer text could easily
                   recognise the error and repair the error.
02.0954 12 ^obs01: 01-|02-04-05-06-07-08-09-10-11-12-13-: TWO or more rules (T1);11b
02.0964 13 ^obs01: 01-|02-04-05-06-07-08-09-10-11-12-13-14-: TWO or more rules (T1);11b
02.0988 13 ^obs01: 14-|01-02-04-05-06-07-08-09-10-11-12-13-: TWO or more rules (T1);11b
          Comment: The extra verse contains information about the length of the role. It is not very likely that
                   a copyist having text 14 as his layer text would copy this obviously extra information into
                   his text.
02.0998 12 ^obs01: 01-|02-04-05-06-07-08-09-10-11-12-13-: TWO or more rules (T1);11b
```

11.2.2.3 'Extra' Verses in All Texts: Judgement Philologist Needed

```
02.0002 12 ?obs01: 01-02-04-05-06-07-08-09-10-11-12-13-: TWO or more rules in all (non-empty) text verses;11b;
                   philologist...
It is not possible to derive new clear text-genealogical variation formulas from the extra rules near verse
02.0002:
a.    We see that the order of the names Lanseloet and (scone) Sandrijn in the title on the title page is
      different: the Lanseloet-Sandrijn order occurs in texts 02-06-07-08-, while the Sandrijn-Lanseloet order
      occurs in 04-05-09-10-11-12-13- (Sandrijn is not mentioned by name in title/incipit of 01). The accompanying
      formula is:
     02.0002 11 ?obs01: 02-06-07-08-|04-05-09-10-11-12-13-: W.O "lanslot"-"sandrin" (T2);8;
      As has been expressed in the question mark in the formula (see also chapter 8 of this appendix), I have
      doubts to use the order of words as text-genealogical informants.
b.    In texts 04-05-09-10-11-12-13 is expressed that the text is to be read: "om (te) lesen". This can be
      expressed in a formula:
     02.0002 11 ^treat: 5ch.wrd "lesen" in 04-05-09-10-11-12-13- (rest: 02-06-07-08-);11a?
      I do not know, at this moment, how this information can provide us clear, undisputed text-genealogical
      information.
c.    In texts 09-12-13- is expressed that the text is to be read by 'jonge luyden'. This can be
      expressed in a formula:
     02.0002 11 ^treat: 5ch.wrd "(jonge) luden" in 09-12-13- (rest: 02-04-05-06-07-08-10-11-);11a?
```

I repeat that I do not know, at this moment, how this information can provide us good text-genealogical information.

12. REMAINDER: '+COMB' VARIATION FORMULAS, NOT REJECTED BY THE COMPUTER

12.2 ALL '+COMB' VARIATION FORMULAS: FILTERED AFTERWARDS BY HAND AND COMPUTER

12.2.1 GERMAN/DUTCH CASES

According to characteristic 7c, a variant may not be a word that uniquely belongs to one specific dialect or language and that is unknown in other dialects or languages. Texts 06, 07 and 08 were printed in Cologne: these texts show unique 'German-like' words, which do not occur in the other texts. Characteristic 7c forbids to use them as text-genealogically informative variants. We could easily teach the computer to recognize these specific non-informative German-like words.

12.2.1.1 German/Dutch Cases dealing with 'lifde' and 'minne' (not in rhyming position)

In the following variation formulas is expressed that the noun or verb 'min(nen)' has been replaced in the German texts by 'lifde', 'lif han', 'lif hebben'.

```

```

We should ask ourselves whether the occurrence of 'minne(n)' in the German texts is a

parallelism. We find many places in which the German texts show a form of the word ‘minne(n)’:

- 02.56: the verb ‘minne(n)’ in rhyming position in texts 02, 04 to 14;
- 02.84: the noun ‘minne(n)’ in rhyming position in 01, 02, 05 to 14;
- 02.85: texts 02, 06, 07, 08, have ‘dorper minne’ (having corrected the evidently erroneous ‘minue’ in 02), not standing in rhyming position;
- 02.145: the verb ‘mint’, not in rhyming position, in texts 01, 02, 05 to 14;
- 02.192: the verb ‘mint’ is standing in rhyming position in 01, 02, 05, 09 to 13, rhyming with ‘vint’; the German verses have ‘vrit’ (from: ‘vrijen’) by which the rhyme with ‘vint’ is broken in the German texts;
- 02.470: the noun ‘minnen’, not in rhyming position, in 01, 02, 05 to 13;
- 02.575: the verb ‘(be)minne(n)’ in rhyming position in 01, 02, 06 to 14;
- 02.576: the verb ‘minne’, not in rhyming position, in 01, 02, 05 to 14;
- 02.614: ‘(be)mint’ in rhyming position in 01, 02, 05 to 14;
- 02.666: texts 01, 02, (05,) 09 to 13 have the noun ‘minnen’ in rhyming position, (assonantically) rhyming with ‘(ge)vinden’ or ‘(ge)winnen’ in the next verse (in texts 01, 02, 05 to 13), while the German texts 06, 07 and 08 have ‘lifden’, logically not rhyming with ‘vinden’;
- 02.778: the noun ‘minne’ in rhyming position in texts 01, 02, 04 to 13;
- 02.789: the verb ‘(be)mint’ in rhyming position in texts 01, 02, 04 to 13;
- 02.832: the verb ‘(be)mint’ in rhyming position in texts 01, 02, 05 to 14;
- 02.992: the verb ‘mint’ in rhyming position in texts 01, 02, 04 to 13.

We conclude that the German texts know the word ‘minne(n)’. Nevertheless, many German verses support the global idea that the German texts prefer to speak about ‘liefde’ instead of ‘minnen’. Possibly the word ‘minne(n)’ had a too vulgar, fleshly meaning for the Germans, who, therefore, tried to avoid the use of this word) as possible. However, the word ‘minnen’ survived in the German texts, a.o. when it is standing in rhyming position and could not be replaced easily by another word, without breaking the rhyming scheme, or when the ‘fleshly’ meaning of ‘minne’ is almost inevitable. Notice furthermore, that we may learn from the breaking of the rhyme in the German texts 06, 07 and 08 near verses 02.192 and 02.666 that it is very likely that these texts eventually go back to a Dutch forefather. It is likely that a ‘German’ tendency to replace ‘minne’ did exist. Therefore, a clear danger of parallelism exists: we will not use the variation formulas in which the German texts have ‘minne’ and the other texts ‘lifde’ (etc.).

12.2.1.2 Other German/Dutch Cases

The ‘German’ (shorthand) words in the variation formulas below only occur in German texts. Therefore, they can be parallelisms: they may not be used for text-genealogical purposes. This statement must not be interpreted as if the German texts always have ‘German’ forms. Often texts 06, 07 and 08 (and especially texts 06 and 07) have forms that are ‘Dutch’. Compare for instance the verses near verse 02.63, where text 02 has ‘weet’ (in original, not-shorthand form), 06 and 07 have ‘weetet’ and 08 has ‘wysset’.

02.0026 12 comb.: 06-07-|01-02-04-05-09-10-11-12-13-14-="wisse"|"wet"
Comment: The verb ‘wissen’ (or conjugated forms of it) only occurs in the German texts; compare the texts 06, 07 and 08 near 02.26, 02.63, 02.112, 02.184, 02.293, 02.296, 02.351, 02.445, 02.447, 02.456, 02.480, 02.578, 02.708, 02.789, 02.881, 02.888.
02.0100 07 comb.: 06-07-|09-10-11-12-13-="blomgins"|"blomkens"
Comment: ‘blomchin’ and ‘blomgen’ only occur in German texts.
Compare for the use of the word ‘blom’ in the texs the verses near verse 02.100, 02.519, 02.529, 02.534, 02.855, 02.858, 02.907, 02.930, 02.933, 02.957, 02.959.
Furthermore, I have doubts whether the occurrence of the diminutive of a word is text-genealogically informative. It is remarkable that near verse 02.534 only text 08 has the diminutive ‘blomgen’, while the other texts do not have a diminutive. The same goes for the verses near verse 02.959 in which only the verse of text 14 has the diminutive. Near verse 02.858 text 11, 12, 13 and 14 have the diminutive.
02.0170 05 comb.: 07-08-|02-05-06-="brent"|"bernt"
Comment: This is the only place in the texts in which we find ‘brent’. On this small basis it is not possible to say that ‘brent’ is a strictly German word. However, the MNW, I, col. 1416, states that ‘brenden’ is the/a High German coloured form of ‘branden’.
02.0170 07 comb.: 07-08-|09-10-11-12-13-="brent"|"bernet"
Comment: See previous comment.
02.0184 11 comb.: 06-07-08-|02-05-09-10-11-12-13-14-="wis"|"wet"
Comment: See above, the first comment of this paragraph, near verse 02.0026.
02.0193 05 comb.: 07-08-|01-05-06-="junfrawen"|"jonkfrawen"
Comment: ‘jun’ (= English ‘young’) only occurs in the German texts 07 and 08, and not in German text 06. The (shorthand) word ‘jun’ occurs in text 07 near verses 02.20, 02.193 and 02.231 and in text 08 near verses 02.20, 02.193, 02.231, 02.377, 02.486, 02.698, 02.724, 02.762 and 02.907.
02.0193 06 comb.: 07-08-|10-11-12-13-="junfrawen"|"jonkvrawen"
Comment: See previous comment.
02.0234 07 comb.: 06-07-08-|09-11-12-13-="bin"|"bens"
‘bin’ only occurs in texts 06, 07 and 08; often only text 08 has ‘bin’, while texts 06 and 07 have the Dutch ‘ben’. Compare the verses of texts 06, 07 and 08 near verses 02.51, 02.53, 02.79, 02.80, 02.234, 02.336, 02.443, 02.445, 02.468, 02.481, 02.736, 02.797, 02.877 and 02.958.
02.0299 11 comb.: 06-07-08-|02-04-05-09-10-11-12-13-="sessen"|"eten"
Comment: Words ending with ‘essen’ only occur in German texts. Compare the verses near 02.10 (beseten/besessen (in 08)), 02.236 (gegeten/gegessen (in 08)) 02.237 (vergeten/vergessen (in 06, 07 and 08), 02.299, 02.713 (gheseten/gesessen (in 06, 07 and 08). More in general, all words ending with ‘ssen’ only occur in German texts. Compare the verses near 02.10, 02.11, 02.16, 02.19, 02.80, 02.94, 02.160, 02.236, 02.237, 02.299, 02.315, 02.351, 02.352, 02.444, 02.480, 02.522, 02.523, 02.531, 02.532, 02.535, 02.578, 02.662, 02.708, 02.713, 02.876,

02.0303 06  comb.: 07-08-|02-06-09-11-="garu"|"garne"
          Comment: This is the only place where ‘garu’ can be found. In original, not-shorthand form, verse
                   02.303 has ‘gaerne’, 06.309 ‘gaerne’, 07.308 ‘gaerue’ (a printer’s error: the ‘n’ has been
                   turned 180 degrees and became a ‘u’), 08.309 ‘garue’ (possibly derived from ‘gaerue’). Nor the
                   MNW, nor the MNHw give ‘gaerue’ or ‘garue’ in a lemma. In other words: the shorthand word
                   ‘garu’ may be considered as a nonsense reading, which may not be used for text-genealogical
                   purposes. Strictly speaking, this variation is not a pure German variant, as the other
                   variants in this paragraph.
02.0303 08  comb.: 07-08-|01-04-05-10-12-13-="garu"|"gerne"
          Comment: See previous comment.
02.0306 06  comb.: 04-05-10-|06-07-08-="tide"|"tsiden"
                   I have traced all words with ‘tsi’: they only occur in the German texts 06, 07 and 08.
                   Therefore they can be parallelisms. Compare the verses near 02.35, 02.128, 02.306, 02.374,
                   02.489, 02.516, 02.613 and 02.1005.
02.0306 06  comb.: 06-07-08-|09-11-14-="tsiden"|"tits"
          Comment: See previous comment.
02.0306 05  comb.: 12-13-|06-07-08-="tids"|"tsiden"
          Comment: See previous comment.
02.0351 11  comb.: 06-07-08-|02-05-09-10-11-12-13-14-="wissen"|"weten"
          Comment: See the comment near verse 02.0026 in this paragraph.
02.0364 10  comb.: 06-07-|02-05-09-10-11-12-13-14-="engen"|"enige"
          Comment: This is the only place in which ‘engen’ occurs. In the original, not-shorthand form, text 02
                   has ‘enighe’, texts 06 and 07 have ‘engen’ and text 08 has ‘eynigen’. I am convinced that
                   ‘engen’ is a nonsense reading (see also ‘garu’, above in this paragraph, near 02.303), which
                   may not be used for text-genealogical purposes. When we assume that texts 06, 07 and 08 go
                   back to the same forefather, it is likely that this common ancestor had the incorrect ‘engen’.
                   The copiist/printer of text 08 (or a forefather of that text) recognized the error and
                   corrected it into the correct ‘eynigen’, I assume. If my assumptions are correct, we see that
                   errors are not copied blindly: evident errors can be corrected rather easily.
                   I have traced all occurrences of ‘enig’ and ‘inig’. The German texts have ‘enig’ as well,
                   while the form ‘inig’ only occurs in the German texts. Compare the verses near 02.38, 02.59,
                   02.122, 02.145, 02.364, 02.364, 02.423 and 02.687.
02.0381 08  comb.: 06-07-08-|01-02-03-05-09-="wolts"|"wawts"
          Comment: I have traced all ‘olt’-words in the shorthand corpus of 14 text versions of Lanseloet van
                   Denemerken: they only occur in the German texts, with an exception for the shorthand word
                   ‘verdolt’ near verses 02.443, 02.445 and 02.468. Compare furthermore the verses near 02.145,
                   02.216, 02.381, 02.747, 02.849, 02.862 and 02.868.
02.0381 06  comb.: 06-07-08-|11-12-13-="wolts"|"wawet"
          Comment: See previous comment.
02.0408 05  comb.: 02-03-|06-07-08-="got"|"gude"
          Comment: I have traced all shorthand words starting with ‘gu’. They all occur in German texts 06, 07
                   and 08 (except for verses with ‘gulden’ or ‘guldin’, near verses 11.8, 02.746, 02.747 and
                   05.1022, and verses with ‘gunne’ or ‘gunt’ in 14.208 and  02.1010). Most often the (German)
                   ‘gu’-words concern the word ‘guet’ (= ‘good’), which often occurs in texts 06 and 07, while
                   text 08 has ‘guyt’. Compare the verses near 02.131, 02.197, 02.272, 02.299, 02.408, 02.418,
                   02.500, 02.515, 02.651, 02.652, 02.686, 02.714, 02.761, 02.806, 02.829, 02.841, 02.931 and
                   02.949. Admittedly, one could claim that the difference between ‘got’ and ‘gude’ must be
                   treated in the next paragraph, as a difference between a vowel, t/d and a final ‘e’.
02.0408 05  comb.: 12-13-|06-07-08-="goden"|"gude"
          Comment: See previous comment. This difference could be treated as well in the next paragraph, as a
                   difference between vowels and a final ‘en’.
02.0606 04  comb.: 07-08-|09-11-="misselig"|"misseliken"
          Comment: I have traced all shorthand words ending with ‘lig’. They all occur in German texts 06, 07 and
                   08 (especially in text 08), with exception for verse 01.384 which has ‘heilich’ in original,
                   not-shorthand, form. Compare the verses near verses 02.44, 02.46, 02.161, 02.182, 02.271,
                   02.343, 02.384, 02.564, 02.600, 02.606, 02.633, 02.679, 02.684, 02.755, 02.802, 02.809,
                   02.813, 02.818, 02.985 and 02.996.
02.0630 10  comb.: 06-07-|01-02-05-09-10-11-12-13-="welt"|"wawde"
          Comment: This is the only place in which ‘welt’ occurs; text 08 has ‘velt’. Nevertheless it is likely
                   that ‘welt’ is a German word, probably in its meaning of ‘forest’ (modern German: ‘Walt’) or
                   ‘world’ (modern German: ‘Welt’).
02.0637 10  comb.: 06-07-|01-02-05-09-10-11-12-13-="gehisen"|"geheten"
          Comment: Text 08 has in original, not-shorthand, form ‘Geheyschen’. I have traced all shorthand words
                   ‘gehisen’: they only occur in German text 06, 07 and 08. Compare the verses near 02.481,
                   02.637, 02.706 and 02.709.
02.0684 10  comb.: 06-07-|01-04-05-09-10-11-12-13-="spregen"|"sprekt"
          Comment: The shorthand word ‘spregen’ only occurs in the German texts 06, 07 and 08. Compare the verses
                   near 02.17, 02.238, 02.249, 02.251, 02.438, 02.506, 02.566, 02.674, 02.730, 02.733, 02.740,
                   02.746, 02.750, 02.757, 02.972, 02.996.
02.0709 10  comb.: 06-07-|01-04-05-09-10-11-12-13-="gehisen"|"geheten"
          Comment: See the comment near verse 02.0637 in this paragraph.

          Comment: See the comment near verse 02.0606 in this paragraph.
02.0747 05  comb.: 06-07-|02-04-05-="holt"|"hawt"
          Comment: See the comment near verse 02.0381 in this paragraph.
02.0906 05  comb.: 01-10-|06-07-08-="het"|"his"
          Comment: This is the only place in the corpus of 14 Lanseloet van Denemerken text versions in which the
                   shorthand word ‘his’ (English: ‘is called’, ‘has the name’) occurs. On the basis of my
                   knowledge of current, modern German I consider ‘his’ to be a German word.
02.0906 06  comb.: 06-07-08-|11-12-13-="his"|"hite"
          Comment: See previous comment.
```

12.2.2 COMBINATIONS OF CHARACTERISTICS 6 AND/OR 7

Until now, my software is able to detect characteristics 6 (small accidental differences, like 6a: orthographic differences) and 7 (other potential parallelisms, like 7a: differences in inflection or suffixes or 7b: differences in vowels) seperately. I simply forgot to program that combinations of these characteristics are possible as well. The detection of combinations of characteristics can be programmed quite easily.

```
02.0229 08  comb.: 02-06-|04-05-09-11-12-13-="lofdi"|"geloft"
          Comment:   See next comment.
02.0229 08  comb.: 07-08-|04-05-09-11-12-13-="lofde"|"geloft"
          Comment:   The difference is a combination of characteristic 7a and 7b: it concerns a difference in the
                     use of a prefix ‘ge’ and a difference between vowels (characteristic 7b). I will not use
                     both variation formulas (that could be combined into one variation formula: 02.0229 10
                     comb.: 02-06-07-08-|04-05-09- 11-12-13-= "lofdi"/"lofde"|"geloft").
```

```
02.0262 09  comb.: 07-08-|04-05-10-11-12-13-14-="sente"|"sint"
          Comment: The difference is a combination of characteristic 7b (difference between vowels ‘e’ and ‘i’)
                   and characteristic 7a (difference in inflection/suffix: the final vowel ‘e’). Therefore, we
                   will not use this variation formula.
02.0269 10  comb.: 09-11-12-13-|02-04-05-06-07-08-="gonne"|"gan"
          Comment: The difference is a combination of characteristic 7b (difference between vowels ‘o’ and ‘a’)
                   and characteristic 7a (difference in inflection/suffix: an extra ‘n’ plus the final vowel
                   ‘e’). Therefore, we will not use this variation formula.
02.0271 05  comb.: 06-07-|05-09-11-="kwelik"|"kwaliken"
          Comment: This is the only place where ‘kwelik’ is used: in original, not-shorthand form, 02.271 has
                   ‘qualic’, 06.273 and 07.272 have ‘quelic’ (in shorthand: ‘kwelik’) and 08.272 has ‘quelich’.
                   According to MNW, VI, col. 835, ‘quelic’ can be a variant of the adverb ‘qualike’; it is not
                   mentioned that ‘quelic’ is a typically German word; ‘quelich’ is not mentioned as a variant of
                   ‘qualike’.
                   The difference is a combination of characteristic 7b (difference between vowels ‘e’ and ‘a’)
                   and characteristic 7a (difference in inflection/suffix: the final characters ‘en’). Therefore,
                   we will not use this variation formula.

          Comment: The difference is a combination of characteristic 7b (difference between vowels ‘e’ and ‘i’)
                   and characteristic 7a (difference in inflection/suffix: the final vowel ‘e’). Therefore, we
                   will not use this variation formula.
02.0306 06  comb.: 04-05-10-|09-11-14-="tide"|"tits"
          Comment: The difference is a combination of characteristic 6a (small orthographic difference between
                   ‘t’ and ‘d’) and characteristic 7a (difference in inflection/suffix: the final vowel ‘e’).
                   Therefore, we will not use this variation formula.
02.0342 08  comb.: 01-08-|02-05-10-11-12-13-="bragte"|"brogt"
          Comment: The difference is a combination of characteristic 7b (difference between vowels ‘a’ and ‘o’)
                   and characteristic 7a (difference in inflection/suffix: the final vowel ‘e’). Therefore, we
                   will not use this variation formula.
02.0342 04  comb.: 06-07-|09-14-="brogte"|"bragt"
          Comment: The difference is a combination of characteristic 7b (difference between vowels ‘o’ and ‘a’)
                   and characteristic 7a (difference in inflection/suffix: the final vowel ‘e’). Therefore, we
                   will not use this variation formula.
02.0404 06  comb.: 07-08-|01-11-12-13-="wer"|"ware"
          Comment: The difference is a combination of characteristic 7b (difference between vowels ‘e’ and ‘a’)
                   and characteristic 7a (difference in inflection/suffix: the final vowel ‘e’). Therefore, we
                   will not use this variation formula.
                   Furthermore, ‘wer’ only occurs in German texts 06, 07 and 08. Compare the verses near verse
                   02.150, 02.151, 02.181, 02.311 (remarkable: in not-shorthand form text 02 has ‘Wi’, 06 and 07
                   have ‘Wie’, and 08 has ‘Wer’), 02.404 and 02.667.
02.0511 08  comb.: 06-07-08-|09-10-11-12-13-="rok"|"ruke"
          Comment: The difference is a combination of characteristic 7b (difference between vowels ‘o’ and ‘u’)
                   and characteristic 7a (difference in inflection/suffix: the final vowel ‘e’). Therefore, we
                   will not use this variation formula.
02.0734 06  comb.: 06-07-|09-11-12-13-="holpen"|"hulpe"
          Comment: The difference is a combination of characteristic 7b (difference between vowels ‘o’ and ‘u’)
                   and characteristic 7a (difference in inflection/suffix: the final character ‘n’). Therefore,
                   we will not use this variation formula.

                   and characteristic 7a (difference in inflection/suffix: the final vowel ‘e’). Therefore, we
                   will not use this variation formula.
02.1010 07  comb.: 06-07-|09-10-11-12-13-="gon"|"gunne"
          Comment: The difference is a combination of characteristic 7b (difference between vowels ‘o’ and ‘u’)
                   and characteristic 7a (difference in inflection/suffix: an extra ‘n’ plus the final vowel
                   ‘e’). Therefore, we will not use this variation formula.
```

12.2.3 VARIANTS, NOT OCCURRING IN DICTIONARY WITH TEXT-GENEALOGICALLY UNINFORMATIVE WORD CATEGORIES

When potential variation formulas are built with variants belonging to text-genealogically uninformative word categories like adverbs, adjectives (I am not sure about this category), auxiliaries or highly frequent verbs, mixed category, (personal) pronouns, etc., these variation formulas are rejected by the software, since we are only interested in substantives and verbs as text-genealogically informative variants. The text-genealogically unimportant word categories contain certain words, as described in chapter 4 of this appendix. After running the

software, it became clear that some words have to be added to the unimportant word categories. If words like ‘altemal’, ‘dorperlik’, ‘geris’, ‘gise’, (the adjective) ‘got’, (the adjective) ‘gode’, ‘harde’, ‘hastelik’, ‘hastilik’, ‘laken’, ‘ligtelik’, ‘like’, ‘(ten) minste’, ‘mogen’, ‘moten’, ‘omme’, ‘onser’, ‘samen’, ‘salt’, ‘selven’, ‘sidi’, ‘sint’, ‘tfi’, ‘twe’, ‘ungelont’, ‘uter’, ‘utter’, ‘war’, ‘wawdet’, ‘weg’, ‘werwarts’, ‘werwert’ would have been part of the unimportant categories, the next formulas would have been rejected automatically:

```
02.0040 12  comb.: 04-05-|02-06-07-08-09-10-11-12-13-14-="altemal"|"mal"

```

12.2.4 VERB-VARIANTS VERSUS NOUN-VARIANTS

In the next eight variation formulas a substantive variant stands accross a verbal variant. These variation formulas must be rejected because the variants belong to different word categories (= characteristic 4b).

```
02.0746 09  comb.: 01-02-04-05-|09-10-11-12-13-="spreken"|"penningen"
02.0746 08  comb.: 06-07-08-|09-10-11-12-13-="spregen"|"penningen"
02.0747 08  comb.: 02-04-05-|09-10-11-12-13-="penningen"|"spreken"
02.0747 08  comb.: 06-07-08-|09-10-11-12-13-="penninge"|"spreken"
          Comment: One could also say that these four variation formulas near verses 02.746 and 02.747 consist of
                   variants, standing in different places of variation (see the next paragraph).
02.1010 08  comb.: 04-05-|02-09-10-11-12-13-="gonne"|"got"
02.1012 05  comb.: 04-05-|11-12-13-="geprent"|"testament"
02.1012 04  comb.: 04-05-|07-08-="tantwerpen"|"endet"
02.1012 05  comb.: 07-08-|11-12-13-="endet"|"testament"
```

12.2.5 DIFFERENT PLACES OF VARIATION

The detection of whether variants are standing at the same place of variation depends on the position of variants in the verses: their left and right position in a rule are compared, without taking into consideration, for instance, the direct neighbours of the variants. The detection of same places of variation will only work optimally when the verses have more or less the same words in the same positions. Happily, the verses of the *Lanseloet* texts are very much alike. Sometimes, however, the verses differ, caused by a difference in word order, by the renewal of parts of verses or by inversion of complete verses. In that case the observations of same places of variation is not optimal. It will be clear that these observations will become of

higher quality when the position of the neighbours of variants are taken into account as well. Then, the next five variation formulas would not have occurred:

```
02.0545 09  comb.: 12-13-|02-05-06-07-09-10-11-="gan"|"lit"
          Comment: Text 12 and 13 have more or less the same readings; but they cannot be easily compared with
                   the other texts, because they have differently constructed verses  (see also 02.746 and
                   02.747).
02.0896 09  comb.: 01-02-|05-06-07-09-11-12-13-="her"|"denemerken"
02.0993 12  comb.: 07-08-|01-02-04-05-06-09-10-11-12-13-="lifde"|"wille"
02.1005 08  comb.: 06-07-08-|09-10-11-12-13-="lif"|"got"
02.1012 05  comb.: 04-05-|11-12-13-="tantwerpen"|"testament"
```

12.2.6 SMALL DIFFERENCES, NOT TREATED BY THE SOFTWARE YET

The following variation formulas concern variants that differ slightly; these slight, accidental or parallelistic, small differences are not treated by the software yet:

```
02.0321 09  comb.: 02-05-|06-07-09-10-11-12-13-="vrinsgap"|"vrintsgap"
02.0385 12  comb.: 02-03-05-06-07-08-|01-09-10-11-12-13-="graki"|"grati"
02.0402 09  comb.: 06-07-|01-05-09-10-11-12-13-="denket"|"dunkt"
02.0579 11  comb.: 05-08-|01-02-06-07-09-10-12-13-14-="kompt"|"komt"
02.0661 04  comb.: 02-06-|07-08-="makse"|"maket"
02.0661 07  comb.: 02-06-|09-10-11-12-13-="makse"|"maktse"
02.0661 07  comb.: 07-08-|09-10-11-12-13-="maket"|"maktse"
02.0740 08  comb.: 02-10-|04-05-09-11-12-13-="gise"|"ise"
02.0808 08  comb.: 02-06-|05-09-11-12-13-14-="doget"|"dugden"
02.0808 08  comb.: 07-08-|05-09-11-12-13-14-="dogent"|"dugden"
          Comment: MNW II, col. 264, gives the following parallelistic forms of ‘doget’: ‘doeget’, ‘doocht’,
                   ‘doecht’, ‘deucht’, ‘doegt’, ‘dueget’, ‘duegt’, ‘docht’ and ‘dogent’.
02.0890 10  comb.: 06-07-|01-02-05-09-10-11-12-13-="gewinden"|"gewinnen"
          Comment: This is the only place in which ‘gewinden’ occurs. Therefore, it is difficult to say that it
                   is a typical German word.
02.0960 04  comb.: 02-06-|01-07-="vrogde"|"vrawde"
02.0960 05  comb.: 02-06-|04-05-14-="vrogde"|"vrugt"
02.0960 06  comb.: 02-06-|09-11-12-13-="vrogde"|"vrugden"
02.0960 05  comb.: 01-07-|04-05-14-="vrawde"|"vrugt"
02.0960 06  comb.: 01-07-|09-11-12-13-="vrawde"|"vrugden"
02.0964 04  comb.: 02-06-|01-07-="vrogde"|"vrawde"
02.0964 08  comb.: 01-07-|04-09-10-11-12-13-="vrawde"|"vrugde"
02.0968 10  comb.: 01-07-|04-05-09-10-11-12-13-14-="vrawden"|"vrugden"
02.0994 06  comb.: 04-05-|09-11-12-13-="hosgit"|"hushit"
```

12.2.7 SPECIAL CASES

```
02.0045 12  comb.: 01-05-|02-06-07-08-09-10-11-12-13-14-="dleven"|"leven"
          Comment: If the software to detect differences in word boundaries would have been able to split up
                   ‘dleven’ in ‘d’ and ‘leven’ this variation formula would not have occurred.
02.0070 07  comb.: 06-07-08-|01-04-05-09-="min"|"wane"
02.0070 08  comb.: 01-04-05-09-|11-12-13-14-="wane"|"wet"
02.0070 07  comb.: 06-07-08-|11-12-13-14-="min"|"wet"
          Comment: As expressed in the theory, I think that words that express an opinion or communication act
                   (like ‘think’, ‘believe’, ‘say’, etc.) can be replaced rather easily by other words.
                   Therefore, these words carry the danger of parallelism and must not be used for the
                   development of text trees. See also the equivalent variants of verses 02.0398 and 02.0603 in
                   this paragraph.
                   (We can, furthermore, investigate whether the verbs ‘weten’ and ‘wanen’ occur in the German
                   texts 06, 07 and 08. If ‘weten’ and ‘wanen’ do occur in them, we can be pretty sure that the
                   occurrence of ‘minen’ in this verse is not a parallelism. Forms of the verb ‘weten’ occur a.o.
                   near verses 02.63 (in 06-07-08 ‘wet(et)’), 02.112 (in 06 ‘weten’, 07 ‘wet’, 08 ‘wis’), 02.293
                   (in 06-07 ‘wet’, in 08 ‘wis’), etc. We conclude that the German texts know the verb ‘weten’.
                   Forms of the verb ‘wanen’ occur near verses 02.398 (06-07-08-10 have ‘min(e)’ (from the verb
                   ‘meinen’), while 01-02-03-05-09-11-12-13 have ‘wan(e)’), 02.631 (01-02-05-06-07 have ‘wan(e)’,
                   08 has ‘wa’ (an ‘n’ has disappeared), while 09-10-11-12-13 have ‘min(d)e’). So the German
                   texts know the verb ‘wanen’ as well.)
02.0119 06  comb.: 02-05-|09-11-12-13-="ontrinen"|"ontrinigen"
          Comment: See next comment.
02.0119 06  comb.: 06-07-|09-11-12-13-="ontrine"|"ontrinigen"
          Comment: MNW, V, cols. 1191-1192 learn that both words ‘ontreinen’ en ‘ontreinigen’ are used with (more
                   or less) the same meaning. Therefore they can be parallelisms: they must not be used as
                   building stones for a chain. Furthermore, it is a text-genealogical condition that two
                   variants (verbs or substantives) must differ considerably when they are used for text tree
                   building purposes. Here, both variants contain the same keyword or core: ‘rein’. When variants
                   contain the same keyword (or: core), they do not differ considerably and, therefore, being
                   potential parallelisms, they may not be used as text-genealogical variants. See also the
                   remarks near the variants ‘sigheden’ and ‘sikten’ near verse 02.0292 in this paragraph and the
                   remarks near 02.0848 concerning the ‘likteken’ variants.
02.0147 10  comb.: 06-07-|01-02-05-09-10-11-12-13-="lift"|"lit"
          Comment: See next comment.
02.0147 10  comb.: 08-14-|01-02-05-09-10-11-12-13-="left"|"lit"
          Comment: 06, 07, 08 have ‘left/lift in’, while ‘in’ is absent in 14; because the slightly different
                   context in text 14, we may not combine both variation formulas into one formula 06-07-08-14-
                   |01-02-05-09-10-11-12-13-; possibly, the combination 06-07-08-|01-02-05-09-10-11-12-13- is
                   allowed; as we will see, this artificial combination doesnot provide new information, since
                   other variation formulas clearly show already that texts 06, 07 and 08 are a type-2 end group.
02.0252 07  comb.: 06-07-|04-05-09-10-11-="pensen"|"pisen"
          Comment: The MNW and Kilianus (kol. 488) present ‘pinsen’, ‘peinsen’ and ‘peisen’ as variant forms of
                   the verb ‘pensen’. Because the danger of parallelism is evident, we will not use this
                   variation formula. See also the comment a few lines further, near 02.0837.
02.0292 11  comb.: 01-06-07-08-|02-04-05-10-11-12-13-="sigeden"|"sikten"
          Comment: As stated a few lines above (near 02.0119 where ‘ontrine’ and ‘ontrinigen’ are treated) it is
                   a text-genealogical condition that two variants (verbs or substantives) must differ
                   considerably when they are used for text tree building purposes. Here, both variants contain
                   the same keyword or core: ‘siec’. When variants contain the same keyword, they do not differ
                   considerably and, therefore, being potential parallelisms, they may not be used as text-
                   genealogical variants.
02.0346 09  comb.: 07-08-|05-06-09-10-11-12-13-="angesigt"|"ansigt"
```

```
          Comment: The difference between the variants consists of an ‘infix’ ‘ge’, which is likely to be a
                   insignificant difference.
02.0398 09  comb.: 06-07-08-|01-05-09-11-12-13-="mine"|"wane"
          Comment: See next comment.
02.0398 05  comb.: 02-03-|06-07-08-="wan"|"mine" (^:W1=Mx;4b-)
          Comment: As expressed near verse 02.0070 in this paragraph, these variants carry the danger of
                   parallelism and should not be used.
02.0399 12  comb.: 09-10-11-12-13-|01-02-03-05-06-07-08-="~ansag"|"~sag" (wds r.p;5)
          Comment: Possibly, this variation formula may look ‘healthy’. However, the point is that both variants
                   have the same core ‘sag’; ‘an’ may be considered as a prefix. Therefore, the difference
                   between the variants is rather small.
02.0525 05  comb.: 01-14-|05-09-11-="regte"|"regtvardikhit"
          Comment: See next comment.
02.0525 06  comb.: 01-14-|06-07-08-10-="regte"|"regtverdikhit"
          Comment: See next comment.
02.0525 04  comb.: 01-14-|12-13-="regte"|"regtvardighit"
          Comment: See next comment.
02.0525 06  comb.: 01-14-|06-07-08-10-="warhit"|"regtverdikhit"
          Comment: See next comment.
02.0525 04  comb.: 01-14-|12-13-="warhit"|"regtvardighit"
          Comment: See next comment.
02.0525 06  comb.: 12-13-|06-07-08-10-="regtvardighit"|"regtverdikhit"
          Comment: We could combine the previous variation formulas into one new variation formula:
                     02.0525 11  comb.: 01-14-|05-06-07-08-09-10-11-12-13-="regte warhit"|
                                         "regtverdikhit/regtvardikhit/regtvardighit"
                   However, when we study the variation in its context we see that the rhyming scheme is not
                   optimal here, which makes the variants ‘suspicious’. Notice furthermore, that when we would
                   have defined the word ‘regte’ as an adjective,  the first three variation formulas of verse
                   02.0525 would have been rejected.
02.0619 11  comb.: 02-06-07-08-|01-05-09-10-11-12-13-="gewandert"|"gewandelt"
          Comment: In Plantijn 1573 (= Thesaurus Theutonicae linguae. Schat der Nederduytsche spraken. Plantijn
                   1573) we read: w a n d e l e n,  w a n d e r e n, se pourmener ou cheminer". We conclude that
                   the risk that both words are parallelisms is present. Therefore, we will not use the variation
                   formula.
02.0631 06  comb.: 09-10-|02-05-06-07-="mine"|"wan"
          Comment: See next comment.
02.0631 07  comb.: 11-12-13-|02-05-06-07-="minde"|"wan"
          Comment: See next comment.
02.0631 05  comb.: 09-10-|11-12-13-="mine"|"minde"
          Comment: As expressed near verse 02.0070 in this paragraph, these variants carry the danger of
                   parallelism and should not be used.
02.0754 10  comb.: 04-05-|01-02-06-09-10-11-12-13-="jonkfrawe"|"vrawe"
          Comment: Only texts 04 and 05 have ‘jonk’ connected to ‘frawe’. The risk of parallelism exists since
                   ‘jonkfrawe’ can easily turn to ‘frawe’/‘vrawe’ and vice versa.
02.0837 08  comb.: 06-07-08-|09-10-11-12-13-="pense"|"pise"
          Comment: MNW, VI, kol. 260: "In Voc. Cop. is ‘peysen’ (‘peynsen’) behalve van "pensare", vertaling van
                   "cogitare" en "meditare" (...) Kil. ‘peynsen’, ‘peysen’, ‘pensen’ (kol. 488), cogitare, (...)
                   vulgo ‘pensare’." (Voc. Cop. = Vocabularius copiosus, Leuven, Johannes de Westphalia, c.
                   1483.) See also the comment near verse 02.0252 in this paragraph. Again we conclude that the
                   danger of parallelism is clearly present: we will not use this variation formula as a text-
                   genealogically informative formula.
02.0842 06  comb.: 01-10-|02-06-07-08-="likteken"|"littiken"
          Comment: See next comment.
02.0842 06  comb.: 01-10-|09-11-12-13-="likteken"|"litteken"
          Comment: See next comment.

          Comment: See next comment.
02.0848 08  comb.: 01-05-10-|09-11-12-13-14-="likteken"|"litteken"
          Comment: Variants of ‘likteken’ occur at several places in the Lanseloet van Denemerken text versions.
                   (See also the analogous variants near verses 02.0918, 02.0923, 02.0943 and 02.0949 in this
                   paragraph.) All these variants are very much alike, carrying the same element
                   ‘teken’/‘teiken’, which should alarm us that these  variants are possibly parallelistic.
                   Furthermore, the MNW warns us that it is likely that in the several variant forms of (the
                   lemma) ‘Lijcte(e)kijn’ different words have been clustered. MNW, IV, col. 626 gives a.o. the
                   following forms at the lemma ‘Lijcte(e)kijn’: ‘lijcteiken’, ‘lijcte(e)kin’, ‘lijcte(e)ken’,
                   ‘littekijn (-in, -en)’, ‘litekijn (-in, -en)’, ‘lidteeken’, ‘lidtteken’ and remarks a.o. that
                   "(...) de vele schrijfwijzen van het woord in het Mnl. maken het waarschijnlijk, dat hier
                   verschillende woorden zijn dooreengeloopen." Although, I admit, I do not understand or see the
                   origins of the variants of ‘Lijcte(e)kijn’, it is, nevertheless, clear that the danger of
                   parallelism is present. Therefore, we will not use the ‘Lijcte(e)kijn’ variants as text-
                   genealogically informative variants.

          Comment: See the comment on the ‘likteken’-variants a few lines above, near 02.0848.
02.0923 06  comb.: 01-05-10-|06-07-08-="likteken"|"tiken"
          Comment: See the comment on the ‘likteken’-variants a few lines above, near 02.0848.
02.0923 07  comb.: 01-05-10-|09-11-12-13-="likteken"|"teken"
          Comment: See the comment on the ‘likteken’-variants a few lines above, near 02.0848.
02.0928 09  comb.: 06-07-08-|05-09-10-11-12-13-="bis"|"dalde"
          Comment: Text 02 has ‘bete’, which is used here as the past tense of the verb ‘beten’. The MNW, I, col.
                   1148-1149, informs us that two variants of ‘beten’ are ‘beeten’ and ‘beiten’, and that the
                   medieval High German (‘mhd’) form is ‘beizen’. Furthermore it tells us that ‘beten’ is often
                   used together with ‘neder’; it refers further to the lemma ‘Nederbeten’ (see MNW, IV, cols.
                   2244-2245, which means a.o. ‘(af)dalen’. The WNT does not have a lemma ‘Nederbijten’ (nor
                   ‘Nederbeten’), nor does it mention the meaning ‘(af)dalen’ at the lemma’s ‘Bijten’ and
                   ‘Bijsen’. Mak does give the lemma ‘Biesen’, but not in the meaning of ‘(af)dalen’. I guess
                   that the verbs ‘(neder)beten’ and ‘dalen’ where synonyms in the Middle Dutch dialects; at the
                   start of the sixteenth century ‘(neder)beten’ got more and more out of (common) use in the
                   Dutch dialects, while it survived in the High German dialects. Words that get out of use may
                   not be used for text-genealogical purposes.
02.0941 06  comb.: 02-04-05-|11-12-13-="dogde"|"dedet"
          Comment: See next comment.
02.0941 05  comb.: 06-07-|11-12-13-="dogte"|"dedet"
          Comment: The past tense of the verb ‘doen’ still has in some current Limburgian dialects several
                   equally acceptable shapes: ‘dooch’, ‘dee’, etc. Therefore, I consider the several past tense
```

```
                forms of this verb to carry a highly parallelistic danger.
02.0943 12  comb.: 01-10-|02-04-05-06-07-08-09-11-12-13-="likteken"|"lit"

```

12.2.8 THE REMAINDER: 21 (DERIVED FROM 33) GOOD VARIATION FORMULAS

```
   02.0085 11 comb.: 02-06-07-08-|05-09-10-11-12-13-14-="dorper"|"dorperhit"
          Comment: See next comment: this variation formula will be combined with another variation formula.
   02.0085 10 comb.: 06-07-08-|05-09-10-11-12-13-14-="minne"|"dorperhit"
          Comment: This variation formula can be combined with the previous one. The combination of both
                   variation formulas (also because ‘mnine’ in 02 must be read as ‘minne’) gives raise to the
                   next formula:
02.0085 11  comb.: 02-06-07-08-|05-09-10-11-12-13-14-="dorper minne"|"dorperhit"
---
02.0113 12  comb.: 07-08-|01-02-05-06-09-10-11-12-13-14-="berawen"|"betrawen"
          Comment: One could claim that the difference between both variants is rather small, consisting of a
                   simple ‘t’ and therefore must be rejected as text-genealogically informative. I must stress
                   that although the difference is small indeed, the basic elements of both variants are
                   different: the shorthand word ‘raw’ (‘rouw’ in original shape) is fundamentally different from
                   the shorthand word ‘traw’ (‘trouw’ in original shape): two competitive variants are text-
                   genealogically informative when their basic components (‘cores’, ‘keywords’) differ.
---
02.0168 12  comb.: 01-02-05-06-07-08-|09-10-11-12-13-14-="live"|"likham"
---
02.0179 10  comb.: 07-08-|02-05-06-09-10-11-12-13-="handen"|"tanden"
---
02.0215 11  comb.: 04-05-|02-06-07-08-09-10-11-12-13-="meste"|"beste"
          Comment: ‘meste’ and ‘beste’ are substantives here.
---
   02.0313 09 comb.: 12-13-|02-04-05-08-09-10-11-="vange"|"brenge"
   02.0313 04 comb.: 06-07-|12-13-="bringe"|"vange"
   We combine both 02.0313 variation formulas into one formula:
02.0313 11  comb.: 12-13-|02-04-05-06-07-08-09-10-11-="vange"|"brenge"/"bringe"
                   I would like to stress here two matters. First, that this implementation or combination of
                   several formulas into one new formula can be automated (because most of the times the
                   implementations deal with variants concerning final ‘e’, final ‘en’, final ‘n’ or differences
                   in vowels). Second, that, in our case, the extension of the formulas actually does not lead to
                   another chain. I compared the chain built with the computer detected variation formulas and
                   the chain built with the extented variation formulas. Both chains show exactly the same
                   relationship pattern. In other words, I did not need the extension of the formulas to come to
                   the final chain.
---
   02.0346 09  comb.:  01-02-|05-06-09-10-11-12-13-="ansgin"|"ansigt"
   02.0346 04  comb.:  01-02-|07-08-="ansgin"|"angesigt"
   The combination of both 02.0346 variation formulas, plus the integration of the fact that text 14
   has ‘hangesigte’ (with the ‘Flemish’ superfluous ‘h’) leads to the formula:
02.0346 12  comb.: 01-02-|05-06-07-08-09-10-11-12-13-14-="ansgin"|"(h)an(ge)sigt(e)"
          Comment: Notice furthermore that the variation formula below (02.0945 12 comb.:
                   01-02-06-07-08-|04-05-09-10-11-12-13-="ansgin"|"ansigt") that the German texts know the word
                   ‘ansgin’.
---
   02.0356 08  comb.: 06-07-|09-10-11-12-13-14-="wille"|"ondank"
   02.0356 04  comb.: 02-05-|06-07-="ondanks"|"wille"
   The combination of both 02.0356 variation formulas, plus the fact that text 08 has ‘willen’ leads
   to:
02.0356 11  comb.: 06-07-08-|02-05-09-10-11-12-13-14-="wille(n)"|"ondank(s)"
          Comment: Both ‘ondank(s)’ and ‘wille’ are substantives here.
---
02.0410 11  comb.: 06-07-08-|01-02-05-09-10-11-12-13-="gevangen"|"gekrigen"
          Comment: ‘vangen’ also occurs in 02.386 (and all the other texts, except for the absent verses of texts
                   04 and 14), 02.412 (idem, now with exception for the empty texts 03, 04, 14), 02.644 (texts 01
                   and 05 have ‘ghevanghen’, texts 02, 06 to 13 have ‘vanghen’), 02.702 (text 02 has
                   ‘gheuanghen’, texts 01, 04, 05, 06, 07, 08 and 10 ‘ghevaen’). The (shorthand) word
                   ‘(ge)krigen’ only occurs here, near verse 02.410.
---
02.0443 12  comb.: 01-02-05-06-07-08-|09-10-11-12-13-14-="verdolt"|"gerist"
---
02.0488 10  comb.: 02-05-06-07-08-|09-10-11-12-13-="maget"|"vrawe"
---
   02.0585 09  comb.: 02-06-07-|09-10-11-12-13-14-="lede"|"leven"
   02.0585 08  comb.: 01-08-|09-10-11-12-13-14-="lide"|"leven"
   The combination of both 02.0585 variation formulas leads to:
02.0585 11  comb.: 01-02-06-07-08-|09-10-11-12-13-14-="lede"/"lide"|"leven"
---
02.0611 10  comb.: 02-05-06-07-|09-10-11-12-13-14-="vart"|"sokt"
          Comment: Maybe it would be more accurate to say that the variation formula concerns the variants ‘vart
                   soken’ en ‘sokt’
---
   02.0686 11  comb.: 04-05-|01-02-06-07-09-10-11-12-13-="hort"|"beregt"
          Comment: I integrate in this formulas the fact that text 08 has ‘berigt’, which results into:
02.0686 12  comb.: 04-05-|01-02-06-07-08-09-10-11-12-13-="hort"|"beregt"/"berigt"
---
02.0866 05  comb.: 02-05-|11-12-13-="dogede"|"togde"
          Comment: MNW, II, col. 262, shows that ‘dogen’ can have the meaning ‘lijden, te verduren, te dragen, te
                   doorstaan hebben ...’ (English: ‘to suffer’). MNW, VIII, col. 518, teaches that ‘toghen’ can
                   mean ‘toonen, laten zien’ (English: ‘to show’, ‘to demonstrate’). Evidently, both variants go
                   back to different words, although the difference between them may seem small at first (false)
                   sight.
---
   02.0903 08  comb.: 02-06-07-|09-10-11-12-13-="her"|"ridder"
   02.0903 08  comb.: 01-05-08-|09-10-11-12-13-="here"|"ridder"
   The combination of both 02.0903 variation formulas leads to:
```

```
02.0903 11  comb.: 09-10-11-12-13-|01-02-05-06-07-08-="ridder"|"her(e)"
---
   02.0907 04  comb.: 02-07-|01-05-="jonkfrawe"|"vrawe"
   02.0907 05  comb.: 02-07-|11-12-13-="jonkfrawe"|"blom"
   02.0907 04  comb.: 01-05-|09-10-="vrawe"|"jonkvrawe"
   02.0907 05  comb.: 01-05-|11-12-13-="v11-12-13-="jonkfrawe"|"blom"
```

13. THE END RESULT: THE TEXT-GENEALOGICAL VARIATION FORMULAS

```

Furthermore, §10.2 (inversion of verses in type-1 environment), §11.2.1.2 (empty verses in type-1 environment) and §11.2.2.2 (extra verses in type-1 environment) show that it is very likely that texts 01, 02, 05, 08, 09 and 10 are not intermediate nodes.

In the following box the variation formulas of the previous figure are repeated, now together with some comments concerning the original non-shorthand readings. The comments consist of three parts, not necessarily all present: a, b and c. The comments after a. refer to the texts of the first group of the formula, and the ones after b. to the second group. After c. comments are put referring to texts not present in the formula. As explained, of texts 03, 04 and 14 only fragments are delivered. In the c-comments below, I use ‘03=nd’, ‘04=nd’ and ‘14=nd’ to express that the verses of texts 03, 04 and 05 are not delivered, possibly in combination; ‘03+04=nd’ means that the verses of 03 and 04 are non-delivered or unknown to us.

APPENDIX E: English Translation of Parts of Salemans (1987) on Cladistics

1. *Introduction*

[...] In this paper the basis of a new text-critical method is formulated, which I would like to call *cladistic textual criticism*. [...] I will demonstrate how biologists investigate the genealogies of living species (plants and animals) using the cladistic method. This method, for which the onset was given in 1950 by the biologist Willy Hennig and which is still in development, appears to be a general method, which can also be applied to other scientific fields, like, for instance, text-genealogical research.[1] [...]

3. *Biological genealogical research: classification, taxonomy, phylogenetics and cladistics*

Taxonomy is the art of classification: the arrangement of different elements into categories, groups, etc. It is not an exclusive part of one particular branch of science, but a general discipline. Taxonomic elements or 'taxa' (the plural of 'taxon') are ordered into a hierarchy, based upon the presence or absence of certain 'characters' (or 'characteristics', 'attributes') occurring in these taxa. Throughout the last years, taxonomy has developed enormously, especially within the field of *biological cladistics*. I am convinced that the cladistic taxonomic methods[16] can be used outside of biological scientific territories, for example, in text genealogy.

3.1. *Building blocks of relationship structures: characters and character states*
In taxonomic orderings, taxa are ordered on the absence or presence of certain characters. The fundamental problem is determining which characters can serve to this purpose. [...] Determining whether a character is adequate or not depends upon the purpose to which it serves. When it is used to determine the genealogical relation of taxa, the character has to possess a *relationship-revealing quality or power*. While choosing ordering characters, the researcher has to ask himself continuously whether his chosen characters possess this quality. Usually,

---

[1] The idea that the biological cladistic method can also be applied to the research of the relation of texts or languages, has been voiced by the biologists Platnick and Cameron (1977:380): "The concept that historical interrelationships can be demonstrated only by the presence of shared innovations is fundamental to the fields of textual, linguistic, as well as phylogenetic, reconstruction. ... The ... cladistic analysis is a general comparative method applicable to all studies of historical interrelationships based on ancestor-descendant sequences."

[16] For more of the same mind, see note 1.

the best characters are those which cannot appear or disappear in a species spontaneously.

A *character* is an abstraction (for example, 'colour of eyes'; 'length'; 'presence of wings'). A character state is the way a character manifests itself in a taxon (for example, 'green', 'yellow'; '1 metre', '1 decimeter'; 'having wings'). The *state* is an specification of the character.

Character states can be divided into underived (original) and derived (non-original) character states.[17] The quality of characters is more important than their quantity: with a few characters many taxa can be ordered. For instance, with six characters, each with two character states, theoretically 2x2x2x2x2x2 or 64 taxa can be sorted out. The relation between the number of characters and the taxa to be ordered is exponential. One well-chosen character can often reveal more than thousands of dubious characters can! [...]

3.2. *An intermediate balance: the significance for cladistic textual criticism*

In my opinion, text versions may be considered as taxa for which the relation pattern has to be determined. The characters to be used for that goal have to possess relationship-revealing qualities. From this point of view, the nature of a *reading*, used in generating textual family trees, can be described as *a character state in which a relationship-revealing character manifests itself in a taxon or text version*. This implies that not every textual difference can be used as a character in building text-genealogical trees. Not every textual variant is a relationship-revealing character state! More often it will rather be an exception than a rule that a textual difference can be used as a character state to build a stemma with. Whether we like it or not, we will always have to determine whether the differences between text versions are relationship-revealing, because only with such differences can the relation pattern ('chain' or 'stemma') of these text versions be determined. [...] From a taxonomic point of view, the fundamental idea of many modern text-critical methods that differences and agreements in readings can be determined easily and objectively, is incorrect. A sound choice of relationship-revealing readings is not as simple and obvious as it may appear at first sight. The determination of whether an element of a text version is a relationship-revealing character state has to be sustained with arguments. [...]

---

[17] In the literature on cladistics many concepts are mentioned, which are not of immediate importance for the understanding of cladistic textual criticism. I will explain some of the most frequently employed cladistic concepts. When a derived, non-original character state is occurs uniquely in a single taxon, this character state is called *apomorphic*. An apomorphic character state is known as an *apomorphy*. When two or more taxa share a derived character state, this is entitled as a *synapomorphic* character state (or *synapomorphy*). An original, primitive (= *plesiomorphic*) character state is called a *plesiomorphy*. When several taxa show the same plesiomorphic character state, we have to do with a *symplesiomorphy*.

3.3. *The Wagner network algorithm: the structure of a cladogram*

'Cladograms' or 'relationship structures' or, in text-genealogical terms, 'stemmas', can be generated in several ways. When composing cladograms it is often important to know which character states are original and which are derived. The most important, direct building block of a cladogram is the so-called *monophyletic group.* A group of taxa is monophyletic if all of these taxa go back to a single common ancestor, while it is impossible to point out any single taxon that does not go back to that common ancestor and does not belong to that group of taxa. In other words, the monophyletic group contains the ancestral species and all of the species which descended from that common ancestor. I want to emphasise here explicitly that the 'method of Lachmann' in fact works with monophyletic groups for the development of text genealogies. The Lachmannian monophyletic groups are found with the 'common errors', derived character states. The often so heavily attacked 'method of Lachmann' may be considered as a predecessor of Hennig's method and deserves rehabilitation.

For most philologists the method of building text genealogies from monophyletic groups will hold little fascination, because they claim that usually it will be unclear which character states ('readings' or 'variants') are original and which ones are not. Fortunately, a method exists that enables us to determine the structure ('chain') of cladograms without the interpretation or judgement of character states: *the Wagner network method*.

A Wagner network is the cladistic counterpart of the philological chain. From a Wagner network a cladogram can be created by 'orienting'[19] (or 'rooting', 'polarizing') it, exactly like a philological chain can be oriented into a chain. The Wagner network is made up of interlinked nodes, so-called OTUs and HTUs. OTU is the abbreviation for 'Operational Taxonomic Unit', a taxon which must be given its place in a genealogy or relation structure. HTUs are 'Hypothetical Taxonomic Units', the (untransmitted) hypothetical, inside nodes of a Wagner network, comparable with Quentin's intermediate nodes.

The building of a Wagner network can be done with the twelve-steps algorithm,[20] presented in the next section. This algorithm must be worked through from top to bottom, step by step. Only when the algorithm explicitly states that one is to skip to another step in the algorithm (see, for example, step

---

[19] [...] When orienting a philological chain into a stemma it is 'pulled up' or branched upwards; when orienting a cladistic network, it is derived downwards ('rooted'). In the cladistics the generating of a network (chain) is called *anagenesis*; the polarisation or orienting of the network is called *cladogenesis*.

[20] An algorithm is a systematic description of the steps to be taken in a certain order to solve a problem. The Wagner network algorithm, presented here in a simplified version, has been derived from Farris (1970:89-90 [corrected by me in 1993; BS), Wiley (1981:176-192) and primarily from notes which I wrote down during the lectures 'Numerical Cladistics' (course number 207 of the educational series 'Taxonomy') in 1986, given by Dr. W. Ellis of the University of Amsterdam.

12), is departure from this top-to-bottom procedure allowed. [...]

The Wagner network algorithm:

1. Build the table of character states of the OTUs.
2. Build the table of distances of the OTUs.
3. Put the value of the 'HTU counter' at 0.
4. Build the first internode of the Wagner network. Procedure: find two OTUs, X and Y, which mutually have the greatest distance from all (couples of) OTUs, as can be determined from the table of distances; connect or join together both OTUs, X and Y, through a line; the result will be the first internode (XY) of the network.
5. Determine the 'work internode' and the 'work OTU'. Procedure: find an OTU with the smallest distance to the first internode; this must not have been placed in the network as yet; the internode XY is called the 'work internode' and the newly found OTU 'work OTU'.
6. Connect the 'work internode' and the 'work OTU' through a HTU and give this HTU a unique name, for example, with a raised 'HTU counter'. Procedure: draw from the middle of the 'work internode' a line to the 'work OTU'; the point at which the line out of the 'work OTU' connects with the 'work internode' is a HTU; raise the value of the 'HTU counter' by 1 and label the HTU on the 'work internode' with the name of the value of that 'HTU counter' at the moment: for example, HTU(1), HTU(2), etc.
7. Determine the median character states of the HTU(value of 'HTU counter').
8. First, expand the table of character states; then, second, expand the table of distances with the data of the HTU(value of HTU counter).
9. Build a survey of the distances of the OTUs which have not yet been connected to all existing internodes.
10. Find in this survey an unconnected OTU of which the sum of distances to all internodes is largest. Call this OTU the (current) 'work OTU'.
11. Find the internode with the smallest distance to the 'work OTU'. Call this internode the (current) 'work internode'.
12. If any unconnected OTU exists go to step 6. Otherwise stop.

3.3.1. *Building Wagner networks with distances between character states*

In this paper I will not discuss in depth the principles behind Wagner networks. Primarily, attention will be paid to the way these networks can be built. Nevertheless, I would like to discuss here briefly the central thought behind building Wagner networks: the notion 'distance'.

With the Wagner network method, taxa (from now on I will call them 'OTUs'), are grouped into a chain on the basis of the knowledge of the *distances* between the OTUs.[21] In a Wagner network, OTUs with many character states in

[21] The idea of determining the distances between nodes in a chain has been formulated, for other

common stand closer to each other than the OTUs with fewer character states in common. When character states are expressed in words, it is difficult to speak about their mutual distance. After all, what is the distance between character states 'black', 'white' and 'grey' of the abstract character 'colour'? When using the Wagner network method the character states are expressed by numbers. In this way it is possible to talk about the distance between character states. The total distance between two OTUs can be determined by adding the distances between the several characters, or, more precisely, character states.

The distance between two character states is equal to the difference between the two numbers which represent these states. Suppose that we specify the colour character states 'black', 'white', and 'grey' with, respectively, the number codes '1', '5' and '3'. The distance between, for example, 5 (white) and 3 (grey) equals 2, for 5-3=2. The distance between 5 and 1 (black) is larger: 4. Notice that it would not have made any difference if we would have chosen for these colours the numbers '5', '9' and '7'. Only *the distances between the character states* are important for the development of Wagner networks. Therefore, the choice to represent 'white', 'black' and 'grey' by '1', '5' and '3', or by '5', '9' and '7' is arbitrary, because the distances are equal. All the characters to be used for the building of the Wagner networks must have the same importance or weight; we then can decide that the maximum distance between the character states equals, let us say, '6'.[22]

The subsequent question concerns how character states can be labelled with the use of numbers. Suppose that we want to assign to all the characters the same weight: '6'. When a character has precisely *two states*, it will be clear that the distance between the OTUs with one state and the other OTUs with the other state must be '6'. As long as the difference between the states equals '6', it is not important which numbers represent the character states. When we label one character state with '7', the other state can be represented by '13' or '1'.

If *more than two character states* exist, the choice of the representation of differences will be more complicated. The different states have to be labelled in such way that the differences in distance between more related states is smaller than the distance between less related states. Suppose that the character 'colour' occurs in the OTUs with the character states 'white', 'grey' and 'black'. If we take grey to be a transitional colour (state) exactly between white and black, we must choose the numbers in such way that the distance between grey and white (or black) equals '3'; the distance between black and white has to be '6'. For instance, for the states white, grey and black we can choose the numbers '1', '4'

---

purposes, in J. Froger's "La méthode de Dom Quentin, la méthode de distance et le problème de la contamination", in *Ordinateurs et critique des textes 1979*, 13-22.

[22] It is possible to assign heavier weights to certain characters. The distance (or the difference) between the character states of these heavier characters is larger.

and ‘7’, or ‘9’, ‘6’, and ‘3’, respectively. It is only important that the transitional colour state grey is represented by a number between the other numbers representing the states white and black.

If character states are considered to be transitional, an interpretation will be given of the order of the development of the character states. This order is expressed in a so-called *transformation order or sequence*, like 1--2--4--7: character state ‘1’ developed into ‘2’, ‘2’ into ‘4’ and ‘4’ into ‘7’. The right-to-left interpretation of this sequence is also allowed. Only the distances between the character states of the OTUs matter. The direction of interpretation of the transformation is not important, but it will often be difficult to build the transformation order, since it is not easy to determine objectively which character states are transitional and which ones are beginning or end states. Such interpretation is not necessary when a character has exactly two states. Therefore, usually it will be convenient and recommendable to build Wagner networks from these *binary characters, with two character states*. [...]

3.3.2. *Example of working with the Wagner network algorithm*

Step 1: Build the table of character states of the OTUs.

Suppose that we want to determine the relationship of six taxa A, B, C, D, E and Pre, and that we have eight characters s, t, u, v, w, x, y and z. After having determined the character states in these OTUs (or taxa), we build a *table of character states*, in which the six OTUs A, B, C, D, E and Pre are put vertically and the eight characters s to z horizontally. Under and beside the table some space is left for later extensions. In the table we note the character states, represented by numbers. A matrix of character states will be the result, for example:

		s	t	u	v	w	x	y	z	--characters-->
O	A	1	0	0	0	0	0	0	2	‘z’ is the character ‘colour’;
T	B	0	0	0	0	0	1	0	0	‘0’ represents, e.g., ‘black’
U	C	1	1	1	1	1	0	0	2	(in B and Pre), ‘1’ repre-
s	D	0	0	0	0	0	1	0	2	‘grey’ (in E) and ‘2’ repre-
	E	0	0	0	0	0	0	1	1	sents ‘white’ (in A, C, D)
	Pre	0	0	0	0	0	0	0	0	

Fig. 9: first table of character states

We see, for instance, that character x occurs in OTUs B and D as state ‘1’ and in the other OTUs as ‘0’. ‘z’ is a character with more than two character states (‘0’, ‘1’ and ‘2’). Notice that the distances between the character states are not equal. The distance between the states of character s is ‘1’ and of z ‘2’. As stated before, usually it is better to choose the same distances between character states to avoid having some character states with a heavier weight. However, we presume that our table is correct.

Step 2: Build the table of distances of the OTUs.

With the table of character states we can build a table of distances between the OTUs. To determine the distance between two OTUs, we add up all the

distances between all the character states of the OTUs. When we compare, for example, the character states of OTUs C and D, we see that the distance for character s between these OTUs is '1', because the difference between '1' and '0' equals '1'. For t the distance is 1, for u 1, for v 1, for w 1, for x 1, for y 0, for z 0: 1+1+1+ 1+1+1+0+0=6. The total distance between C and D is 6, which is inserted into the table of distances. After having calculated all the distances between the OTUs, the first table of distance will be as follows:

	A	B	C	D	E	Pre
A	*	4	4	2	3	3
B	4	*	8	2	3	1
C	4	8	*	6	7	7
D	2	2	6	*	3	3
E	3	3	7	3	*	2
Pre	3	1	7	3	2	*

Fig. 10: first table of distances

[...]

Step 3: Put the value of the 'HTU counter' at 0.

Thus far, no part of a Wagner network exists, because there are no HTUs. The 'HTU counter', which is used to number or label the HTUs as HTU(1), HTU(2), etc., is zero. Each time we perform step 6, the HTU counter will be raised by 1.

Step 4: Build the first internode of the Wagner network.

The building of the Wagner network can now commence. First, we look in the table of distances to find the two OTUs which differ most and, therefore, have the highest mutual distance. We connect these two OTUs, B and C (distance 8) by a line. By doing so, the first internode, a line between two nodes, of the Wagner network has been established:

Fig. 11: the first internode of the Wagner network

Step 5: Determine the 'work internode' and the 'work OTU'; make a connection between the first internode and the OTU with the shortest distance to it.

A third OTU can now be connected to the internode BC. [...] This third OTU must have the smallest distance to the internode BC. To determine the distance from a node to two other nodes, we use the depicted formula.

```
Formula to determine the distance between node Z and the internode XY:
======================================================================
  d(Z/XY) = 0.5 x {d(XZ) + d(YZ) - d(XY)}
                  in which: d(Z/XY) = distance from Z to internode XY
                            d(XZ)   = distance from X to Z
                            d(YZ)   = distance from Y to Z
                            d(XY)   = distance from X to Y
```

In other words, the distance from a node Z to an internode XY can be determined as follows: add the distance from X to Z and the distance of Y to Z; subtract from the result the distance from X to Y; divide that amount by 2.

With this formula we can determine which new OTU has to be attached to the internode. We will use the distance table. The distance from A to the internode BC equals {the distance from A to B (4), plus the distance of A to C (4), minus the distance from B to C (8)} divided by 2: 0.5 x (4 + 4 - 8). This equals 0. The distance from D to BC is 0.5 x (2 + 6 - 8); also 0. The distance from E to BC is 0.5 x (3+7-8) = 1. The distance from Pre to BC is 0.5 x (1+7-8) = 0 [and not 0.5 x (3+7-8) = 1, as stated in Salemans 1987, which Josephie Brefeld (see footnote above) correctly noticed; BS].

We conclude that both A and D [and Pre; BS] have the smallest distance to the internode BC. Therefore, these OTUs can be chosen as the nodes to be connected to the internode. Arbitrarily, we choose A. The more characters we can use for building a network, the bigger the distances between the OTUs will be and the smaller the chances will be that we will have to make arbitrary choices between OTUs to be attached to an internode. [...]

Step 6: Connect the 'work internode' and the 'work OTU' through a HTU and give this HTU a unique name, for example with a raised 'HTU counter'.

The procedure for attaching an OTU to an internode is as follows: first, point out a point at the middle of the internode; from this point, draw a line towards the OTU. The new node on the internode is a Hypothetical Taxonomic Unit (HTU). The HTU counter is raised with 1 and the new HTU is labelled as HTU (HTU counter) (for example, HTU(1), HTU(2), etc.). By raising the HTU counter each new HTU will get a unique name. At the moment our Wagner network looks like:

Fig. 12: Wagner network with first HTU

Step 7: Determine the (median) character states of the HTU (value of 'HTU counter').

Since HTU(1) is a hypothetical node its character states cannot be observed, but have to be calculated separately. For this calculation we use the next rule: in a HTU, a character will show the character state which is the median value of the three OTUs connected through the HTU. The *median value* of three values is one of those three values, namely, the value which lies the closest to the mean value of the three values. So the median value of 0, 3 and 5 is '3': the mean value is 2.666 and so '3' is the closest value. In the table of character states we can look up the character states of A, B and C. With these states we can calculate the median character states of HTU(1).

	s	t	u	v	w	x	y	z
A	1	0	0	0	0	0	0	2
B	0	0	0	0	0	1	0	0
C	1	1	1	1	1	0	0	2
HTU(1)	1	0	0	0	0	0	0	2

Fig. 13: Median determination of character states of HTU(1)

Step 8: Expand (first) the table of character states and then (second) the table of distances with the data of the HTU (value of HTU counter).

We add the character states of HTU(1) to the tables of character states and the table of distances:

	s	t	u	v	w	x	y	z
A	1	0	0	0	0	0	0	2
B	0	0	0	0	0	1	0	0
C	1	1	1	1	1	0	0	2
D	0	0	0	0	0	1	0	2
E	0	0	0	0	0	0	1	1
Pre	0	0	0	0	0	0	0	0
HTU(1)	1	0	0	0	0	0	0	2

Extended table of character states

	A	B	C	D	E	Pre	HTU(1)
A	*	4	4	2	3	3	0
B	4	*	8	2	3	1	4
C	4	8	*	6	7	7	4
D	2	2	6	*	3	3	2
E	3	3	7	3	*	2	3
Pre	3	1	7	3	2	*	
HTU(1)	0	4	4	2	3	3	*

Extended table of distances

Figure 14.

N.B.: Notice that HTU(1) and A are equal; A is in fact the intermediate HTU between C and D.

Step 9: Build a survey of the distances of the OTUs which have not been connected at the moment to all existing internodes.

[...] The Wagner network now has three internodes: A-HTU(1), B-HTU(1) and C-HTU(1). One unconnected OTU must now be attached to this network. First, we build an OTU-internode distance table with the distance formula (see step 5). For example, the distance from E to the internode C-HTU(1) is 0.5 x {distance C to E, plus distance HTU(1) to E, minus distance C to HTU(1)}. Using the extended table of character states, we substitute this into: 0.5 x {7+3-4} = 3. In this way we calculate all the distances from the unconnected OTUs to all the internodes. Result:

	A-HTU(1)	B-HTU(1)	C-HTU(1)	total distance to internodes
D	2	0	2	==> 4
E	3	1	3	==> 7
Pre	3	0	3	==> 6

Fig. 15: survey of OTU-internodes distances

Step 10: Find in this survey a unconnected OTU, of which the sum of distances to all the internodes is largest. Call this OTU the (current) 'work OTU'.

Looking at the survey (fig. 15), we see that node E (distance '7') must be the new 'work OTU'.

Step 11: Find the internode with the smallest distance to the 'work OTU'. Call this internode the (current) 'work internode'.

Looking at the survey (fig. 15), we see that 'work OTU' E is closest to

internode B-HTU(1), which becomes our new ‘work internode’.

Step 12: If any unconnected OTUs exists go to step 6. Else stop.

Because the OTUs D, E (the current ‘work OTU’) and Pre have not been connected to the network, we jump back to step 6. There ‘work OTU’ E will be connected to the ‘work internode’ B-HTU(1) through the new HTU(2). The result is pictured in the next network:

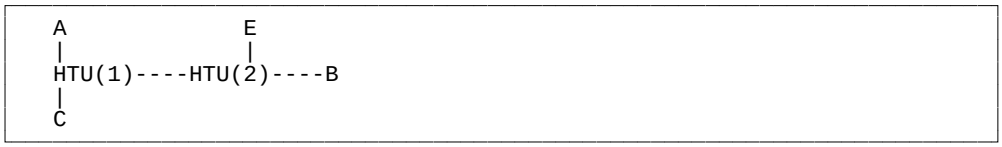

Fig. 16: Wagner network until now with 2 HTUs

End of algorithm; stop:

After the algorithm has been completed and all the OTUs have been attached to the Wagner network, the tables of character states and distances will look as pictured in fig. 17. The helping lines within it mark out the original OTUs and the new artificial intermediate nodes, the HTUs.

	s	t	u	v	w	x	y	z
A	1	0	0	0	0	0	0	2
B	0	0	0	0	0	1	0	0
C	1	1	1	1	1	0	0	2
D	0	0	0	0	0	1	0	2
E	0	0	0	0	0	0	1	1
Pre	0	0	0	0	0	0	0	0
i1	1	0	0	0	0	0	0	2
i2	0	0	0	0	0	0	0	1
i3	0	0	0	0	0	0	0	0
i4	0	0	0	0	0	0	0	1

Definitive table of character states

	A	B	C	D	E	Pre
A	*	4	4	2	3	3
B	4	*	8	2	3	1
C	4	8	*	6	7	7
D	2	2	6	*	3	3
E	3	3	7	3	*	2
Pre	3	1	7	3	2	*

	i1	i2	i3	i4
i1	0	4	4	2	3	3	*	2	3	2
i2	2	2	6	2	1	1	2	*	1	0
i3	3	1	7	3	2	0	3	1	*	1
i4	2	2	6	2	1	1	2	0	1	*

Definitive table of distances

Figure 17.

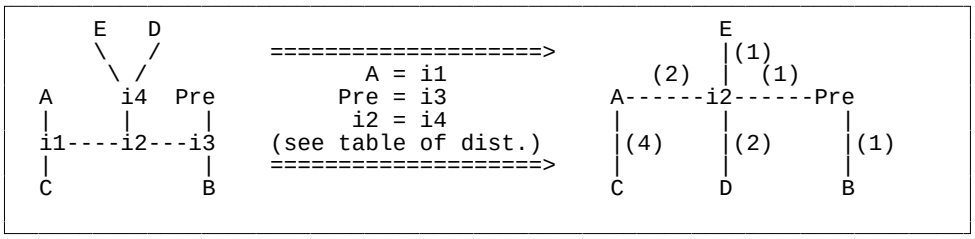

Fig. 18: the definitive Wagner network (right)

In the tables ‘HTU()’ is replaced by the shorter character ‘i’ (from ‘intermediate’) to save space. The Wagner network is pictured in the left part of fig. 18. In the definitive table of distances in fig. 17, we see that the nodes which have a mutual distance of 0 are identical. Therefore, we can cut some HTU-nodes from the network, which results in the definitive Wagner network, pictured in the right part of fig. 18.

Next to the lines of connection in the right network, the distances between the

nodes of the network appear as mentioned in the table of distances (fig. 17) between brackets '()'.

3.3.3. *Rooting ('orienting') the Wagner network ('chain') into a cladogram ('stemma')*

Rooting or orienting a Wagner network is the same as orienting a philological chain. [...] We can pull up the chain at the point where the character states are original. Remember that the character states used until now have not been judged as to their originality. [...] In fig. 19 the Wagner network has been oriented at three different points [1. at Pre; 2. between i2 and D; 3. at E; BS]. This results in three different cladograms (see fig. 19). [...] Notice that the point of rooting or orientation in the second cladogram lies between i2 and D. Lost text versions may be given a place on or imagined at the lines of connection in a chain or stemma. Although the three cladograms do not look the same at first sight they are derived from one and the same network, as pictured in fig. 18.

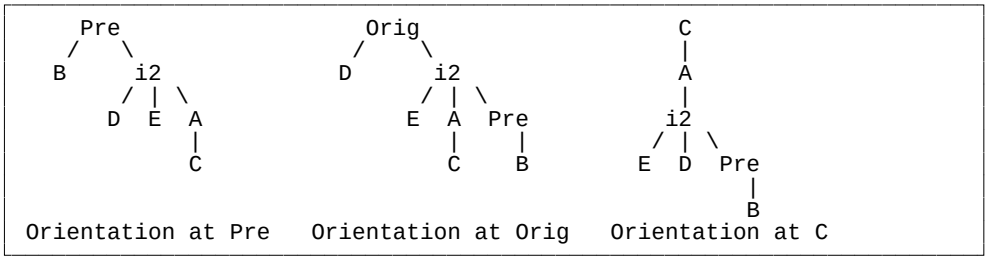

Figure 19.

3.3.4. *The length of a Wagner network: criterion for reliability and guard against contamination and parallelism*

The shorter the realized network is, and, by inference, the more it approaches the theoretical minimum length of the network, the better a network is. [One can judge the previous sentence as an expression of the 'principle of parsimony', as has been discussed in part 3 of the main paper before the Appendices. BS] To formulate it differently, a network is more reliable or consistent than another network if its *quotient of the minimum length and the realized network length* is smaller and comes closer to the value 1. One of the great advantages of Wagner networks is that we can compare several networks with the use of this quotient. Usually the quotient is called *Consistency Index* (CI). The CI in our example equals 9/11 or 0.8181.

We can now briefly discuss the explanation of step 5 of the Wagner network algorithm in section 3.3.2. Both OTU A and OTU D could be attached to an internode. Had we chosen to attach D to the internode, a different network might have resulted. As a matter of fact, it would have been better if we had drawn all the networks which are possible according to the algorithm. Then, with the CI's of these networks we could have picked out the most consistent network. Fortunately, computer programs exist which can calculate quickly the best Wagner

network for us, given a certain amount of characters and character states.[23]

The difference between the minimum network length and the realized network length is due to the fact that not all character states point in the direction of one network. Disturbing factors have emerged. This implies either that the chosen characters and/or character states are incorrect or that contamination(s) or parallelism(s) have occurred. The *CI measures the 'static' (or disturbance) which is due to these incorrect, parallelistic or contaminated characters and their states.* The more disturbing these factors are, the smaller the CI will be.

[23] One of these computer programs is 'TreeTools' of Dr. W. Ellis. [= Ellis (n.d.; 1985?). Ellis points out in the first footnote of the first chapter that the PAUP-package at that time of David Swofford comes close to TreeTools: "After the programs were in their final shape, I received the announcement of David Swofford's microcomputer version, for the IBM PC, of his PAUP package, and of Joe Felsenstein's PHYLIP version for MSDOS and CP/M computers. Judging from the description, especially Swofford's program comes close to TreeTools." BS.]
